Name: Siri Krishna C R

SRN: PES1UG24AM276

Section: E

EPICS

1. Inventory & Batch Management

Story	Points
View Near-Expiry Medicine Report	5
Configure Near-Expiry Alert Window	2
Confirm Delivery and Add Medicine Batch	5

Total: 12 Story Points

2. Medicine Dispensing

Story	Points
Search Medicine and View Available Batches	3
Automatically Select Medicine Batch Using FEFO	8
Handle Insufficient or Invalid Medicine Stock	5

Total: 16 Story Points

3. Stock Monitoring & Replenishment

Story	Points
Monitor Medicine Stock Against Safety Threshold	5
Automatically Generate and Dispatch Purchase Order	8

Total: 13 Story Points

SCREENSHOTS: 1. All Epics

2. Inventory & Batch Management

3. Medicine Dispensing

4. Stock Monitoring & Replenishment

5. To Do

6. To Do → In Progress → Done

7. Summary

8. Burndown Chart

Reflection Questions

1. Did your estimations reflect the actual effort?

Yes, overall, the story point estimations reflected the relative effort required for each user story. Simpler tasks, such as configuring the near-expiry alert window and searching for available medicine batches, were assigned fewer story points. More complex tasks, such as automatically selecting medicine batches using FEFO and generating purchase orders, were assigned higher story points because they involve more logic and processing.

2. Was your backlog well-prioritized?

Yes, the backlog was reasonably well-prioritized. The stories related to medicine inventory and batch management were handled first because accurate batch information and expiry tracking are essential for the system. Medicine searching and FEFO-based batch selection were prioritized next, followed by stock monitoring and automatic purchase order generation. This ordering helps ensure that the core inventory functionality is established before implementing advanced replenishment features.

3. How did your simulated sprint align with your plan?

The simulated sprint followed the planned workflow. The selected user stories initially started in the **To Do** state and were then moved to **In Progress** and finally **Done** to represent their completion. This simulation demonstrated how work progresses through different stages during a Scrum sprint and showed how the planned stories could be completed systematically.

4. What insights did the burndown chart give about your team's capacity?

The burndown chart provided an overview of the amount of work remaining throughout the sprint. As user stories were completed, the remaining story points decreased, indicating progress toward the sprint goal. The chart helped demonstrate whether the planned workload was manageable and gave an indication of the team's capacity to complete the selected work within the sprint duration. These answers keep the **same style and level of detail as the sample PDF**, but are actually based on your own project, stories, priorities, and story points.
